INVISIO Headsets receives breakthrough order for TETRA-market

INVISIO Headsets (IVSO) has received a breakthrough order on the so-called TETRA-market for headsets to public safety users in Portugal. The order is valued at approximately 2 MSEK and is for INVISIO® M3, that uses INVISIO's patented Bone Conduction technology for clear communication in demanding to extreme environments.

"It is not primarily the size of the order that pleases us, but more the fact that this is an order for headsets for use with the digital communications network TETRA and that this order is an important reference for us. It is one of many segments where we see a large market for our products. TETRA-networks are being launched globally and Sepura, who received this order in Portugal, is one of the leading radio manufacturers" says Lars Højgård Hansen, CEO at INVISIO Headsets.

The INVISIO® M3 headsets will be delivered during the first quarter of 2010 and will be used in a communication solution together with Sepura TETRA radios. Sepura plc is a leading supplier of TETRA radios to public safety users and recently announced a major order from the Portuguese Government.

INVISIO Headsets patented microphone technology Bone Conduction picks up speech from vibrations in the jawbone instead of using a traditional, external microphone. The technology provides clear communication in demanding to extreme conditions.

"Our technology is superior for providing clear communication in extreme environments where wind and high noise could potentially disturb important communication and we are convinced that many more professional users will realize that" says Lars Højgård Hansen, CEO at INVISIO Headsets.

INVISIO Headsets is a member of the SEPURA Solutions Partner Programme that aims to stimulate the growth of new solutions and services for the benefit of the global TETRA user community. With an emphasis on quality, the SEPURA programme is targeting specialist companies that are capable of delivering high-value, commercial-grade solutions and services that genuinely serve public safety needs.

About TETRA

Terrestrial Trunked Radio (TETRA) is a digital trunked mobile radio standard developed by the European Telecommunications Standards Institute (ETSI). The purpose of the TETRA standard was to meet the needs of traditional Professional Mobile Radio (PMR) user organisations such as those listed below.

The air interfaces, network interfaces as well as the services and facilities are specified in sufficient detail to enable independent manufacturers develop infrastructure and radio terminal products that would fully interoperate with each other. For example, radio terminals from different manufacturers can operate on infrastructures from other manufacturers. The ability for full interoperability between different manufacturer's

products is a distinct advantage of open standards developed by ETSI. As the TETRA standard is supported by several independent manufacturers this increases competition, provides second source security and allows a greater choice of terminal products for specific user applications.
